claim 2; Page 4; Spri German.
Claim 2; Page 4; Spri German.
The DNA may be used as a hybridisation probe for detecting the HLA B27 gene, e.g. for assessing susceptibility to rheumatic disorders such as ankylosis spondylitis, or may be used to transform cells for prodn. of HLA B27. He HLA B27 may be used to detect HLA B27 antibody in human serum, or to produce mono- or polyclonal HLA B27 antibodies for use in immunoassay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       03-APR-1991 (first entry)
Sequence of genomic DNA encoding human histocompatibility antigen
Sequence of genomic should by the sequence of genomic second human histocompatibility is sequenced by the sequence of the sequence
                                                                                                                                                                                                                                            LU-APR-1991 (first entry)

DNA coding for human histocompatibility antigen HLA-B 27 - useful for diagnosis and antigen and antibody prodn.

for diagnosis and antigen and antibody prodn.

for diagnosis and antigen and antibody prodn.

THE DNA may be used to detect the HLA-B 27 gene (opt. mutated) in human genetic material. The HLA-B 27 may be used to detect anti-HLA-B 27 antibodies in human serum. The antibodies may be used to determine HLA-B 27 lavels in human serum, e.g. for diagnosis of rheumatic disorders, esp. ank/losing spondylitis.

Transgenic non-human mammalian HLA-Bw 52 gene - useful for analysis of expression of gene structure, and prodn. of analysis of expression of gene structure, and prodn. of analysis of expression of gene structure, and prodn. of anose model of human disease

Disclosure; Fig 1; Bpp; Japanese.

Disclosure; Fig 1; Bpp; Japanese.

The sequence shows the exon 2 alpha-1-domain of the human leukocyte antigen. Bw 52 gene. The complete gene may be introduced into non-human mammals, pref. rat or mouse, or their ancestors at the primary developmental biological step via transplantation into the zygote or embryo to generate transgenic non-human mammals contg. HLA-Bw 52 are useful for the analysis of expression of the gene, its structure, and prodn. of mouse models of human disease.

Chuman disease.

Detecting pre-disposition to seronegative spondylarthropathies from the absence of a C residue at a specific position in the 3'-flanking region of the HLA B27 allele

Claim 1; Page 52-56; 68pp; Bnglish.

Claim 1; Page 52-56; 68pp; Bnglish.

Genetic predisposition to seronegative spondyloarthropathies (SNSA) is detectied by determining the absence of a cytosine nucleotide in the 3' flanking region (see also T61647-48) of an HLA-B27 consensus consition corresponding to nucleotide 4495 of the HLA-B27 consensus sequence given in T61639. Probes and primers (see also T61640-46) based on this region can be used in diagnostic assays to detect the genetic predisposition to SNSA, and permit the distinction of B27+ individuals who are resistant to SNSA from B27+ normal individuals who are resistant to SNSA from B27+ normal individuals consensed to SES3 BP; 1443 A; 1619 C; 2017 G; 1474 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human leukocyte antigen; transgenic; germ cells; somatic cells;

Allotype specific monoclonal anti- HLA antibodies prodn. - using hybridomas derived from transgenic animals carrying HLA gene and immunised with HLA antigen of different allotype blsclosure; Fig 1 A-G; 20pp; English.

The human HLA-B51 gene was injected into fertilised mouse eggs and then these introduced into the uterus of a pseudo pregnant mouse. The young were tested to ensure incorporation of the gene into the chromosome, and one of them mated 3 times with a normal male to produce 16 young, seven of which carried the HLA-B51 gene.

The transgeneic offspring were immunised with HLA antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The spleen lymphocytes were fused with myeloma cells. Hybridomas producing antibodies were selected.
                                                                                                                                                                                                                                                                                                                                                                                                                          03-JAN-1991 (first entry)

HLA-B51 gene for production of monoclonal antibodies.

Alloptype specific monoclonal anti-HLA antibodies; hybridomas; transgenic animals; HLA-B51 gene; ss.

Location/Qualifiers

exon 1.73
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps: 10 Gaps: 0 Percent Identity: 80.000

New DNA for class I human leucocyte antigens and derived probes and transformed cells, useful for DNA typing, as immunogens etc.
Claim 2; pp11-12; 23pp; English.
The HLA class I DNA can be used a source of probes for use in DNA typing. Transformed cells, which are useful as immunogens, can be obtained by introducing these DNAs into eucaryotic cells.
Sequence 1086 BP; 223 A; 335 C; 358 G; 170 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The DNA for class I human leucocyte antigens and derived probes and transformed cells, useful for DNA typing, as immunogens etc. Claim 1; Page 11; 23pp; English.

The HLA class I DNA can be used a source of probes for use in DNA cyping. Transformed cells, which are useful as immunogens, can be obtained by introducing these DNAs into eucaryotic cells. Sequence 1086 BP; 224 A; 334 C; 356 G; 172 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    39.00 Length: 10

Human nucleic acid fragments, isolated from brain adrenal tissue, the placenta or bone marrow comprise any of: (A) a sequence selected from (076401-077613), (B) an allelic variation of a sequence as described in (A), or (C) a sequence complementary to (A) or (B).
                                                                                                                                                                                                                              HIA-Bw53 exon.

Hybridomas producing antibodies were selected. Sequence 1089 BP; 223 A; 336 C; 359 G; 171 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Allotype specific monoclonal anti- HLA antibodies prodn. - using hybridomas derived from transgenic animals carrying HLA gene and immunised with HLA antigen of different allotype blsclosure; Fig 1 A-G; 20pp; English.

The human HLA-BW52 gene was introduced into mouse L cells and then these cells used to immunise one of the transgenic mice (See Q05693).
                                                                                                                                                                                                                                                                                                                                                    03-37N-1991 (first entry)
HLA-BW52 gene for production of monoclonal antibodies.
Alloptype specific monoclonal anti-HLA antibodies; hybridomas; transgenic animals; HLA-BW52 gene; ss.

Outer membrane protein of Haemophilus influenzae type B - used as vectine against infections, esp. in infants and for diagnosis. Disclosure: Fig 5: 33pp; English. Plasmid pRSM793 contains only the 3' portion of the Pl gene. The plasmid pRSM793 contains only the 3' portion of the Pl gene. The sequence. The cro-lace-omppl fusion protein produced from pRSM793 was recognised by rabbit and guinea pig Pl-specific antisera in
   exhibit no more than 90% homology to a human

New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. neurological disorders, turbuurs, inflammation or haematological disorders tumnus flavorders, inflammation or haematological disorders Claim 1: Page 170; 215pp; English.

X51701-55 encode human secreted proteins. The polynucleotides and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene treating or ameliorating medical conditions, e.g. by protein or gene treaty. Pathological conditions can also be diagnosed by determining the presence of mutathons in the new polynucleotides. Specific uses are described for each polynucleotide, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, immune disorders, infection, inflammatory disorders, skin disorders, tumours, atherosclerosis, restenosis, autolmmune disorders, Alzheimer's disease, peripheral neuropathies, trauma, spinal cord injuries, allergy, hematopoletic disorders, asthma, immunodeficiency diseases, AIDS and transplant references.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                H. influenzae detection probe #2.

Tati-S. aureaus vaccines

Claim 1; Page 1047-1049; 3271pp; English.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences
of the invention. The DNA sequences are recorded on a computer readable
of the invention. The DNA sequences are recorded on a computer readable
medium, preferably selected from a floppy or hard disk, random access
memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using
that protein-encoding or regulatory regions of commercial, therapeutic or
industrial importance can be obtained. Specifically, sequences which are
likely to encode antigens have been identified and these polypeptides can
be used in a vaccine composition against S.aureus infection. The
collypeptides can also be used in a kit for the immunodatection of
S.aureus in a sample. S.aureus is implicated in numerous human diseases,
including cellulitis, eyelid infections, food poisoning, osteomyelitis,
skin and surgical wound infections, scalded skin syndrome, toxic shock
syndrome, etc. Organisms transforamed with the DNA sequences can be used
for recombinant production of the polypeptides. The new DNA sequences
can their fragments) are useful as primers or probes for isolating
computer readable medium.

/note="Vector: MI3mpl8 Site_l: Hind III; C. parvum (IOWA isolate) genomic DNA was hydrodynamically sheared to produce fragments having a tight size distribution between 1.5 and 3 kb. Adaptors (pGTGATCAA/CAAACCACTGATP) were ligated to the randomly sheared gDNA fragments and pAGCTGTTG linkers were ligated to the Hind III-cleaved MI3mpl8 vector. The adaptor-containing inserts were annealed and ligated to the vector and transformed into E. coli strain DH125. Recombinant phagemid clones from the first plating of the library were randomly selected for sequence analysis using the MI3'-21) forward primer."
